At 10am CDT, Tropical Storm Cristobal was located 15 miles west of Ciudad Del Carmen, Mexico with maximum sustained winds of 60 mph and a minimum central pressure of 995 mb.

On the forecast track, Cristobal will move over the land mass of eastern Mexico through Thursday. Cristobal is then forecast to re-emerge over the southern Gulf of Mexico Friday or Friday night and move northward over the central and northern Gulf of Mexico over the weekend.

Cristobal will likely become a Tropical Depression by Thursday evening, however some re-strengthening is expected to begin on Friday.

There is a risk of storm surge, heavy rainfall, and wind impacts beginning over the eastern beaches of the U.S. Gulf Coast from Texas to the Florida Panhandle.
